

Track 1 – Load Modeling

Revolutionizing Power Demand Forecasting: Cadmus Leads with Innovative Load Modeling

Data Models - Insights on Load Estimates

Cadmus combines multiple data models to process input and provide insights on load estimates.

Factors considered: weather, building type, and time of year.

Model creation: Utilized 3 years of data, 25,000 buildings, and millions of data points with 85% accuracy.

Electrification Factor - Predicting Substation Load

THE MODEL INCORPORATES THE PERCENTAGE OF HOMES WITH ELECTRIFICATION TO PREDICT AND EXPLAIN SUBSTATION LOAD.

USER APPLICATION: INTERACTIVE MODELING, ALLOWING NEW DATA INPUT AND MANUAL FIXED-LEVEL ADDITIONS TO CLIMATE-RELATED EFFECTS.

Energy Demand Insights - Informed Decisions

The user-friendly model provides clear insights into how climate effects and building features impact energy demand.

Optimization: Cadmus enhances the open-source model to help utilities anticipate energy consumption variations based on weather patterns, reducing costs.

Targeted Energy- Saving Initiatives - Grid Stability

- The interpretable model identifies key building features affecting energy consumption, enabling targeted energy-saving initiatives.
- Transparency: The approach fosters trust among stakeholders and aligns with sustainable practices.
- Load Forecasting: The model aids in load forecasting, enhancing grid stability, and preventing blackouts or overproduction of energy.

Trico Electric Cooperative

TRICO
AN ENERGY COOPERATIVE

POWERED WITH PURPOSE

Trico Today

- 47,000 Members (over 51,000 services)
- Majority Residential (95%)
- Energy Sold 819,719 MWh
- 253 MW Peak Summer Demand (less than 100 MW Winter)
- 2,500 square mile service territory
- 4,037 miles of distribution line

Distributed Generation

Trico's Renewable Portfolio

- Approximately 33% of retail sales are from renewable sources
 - 50 MW of Distributed Generation
 - 5,000 installations
 - 25 MW of utility scale solar
 - Avion Solar, Chirreon Solar, Apache Solar
 - Additional 5MW by EOY 2023
- Goal is to invest in renewables and batteries in a cost-effective and sustainable way

Target:
Reduce emissions by 50% by 2032

The Industry is Changing

TRICO

AN ENERGY COOPERATIVE

POWERED WITH PURPOSE.

Three Overarching Trends

- DECARBONIZATION • DECENTRALIZATION • DIGITIZATION

1. Decarbonization of power supply

- Moving away from fossil fuels to generate
- Moving away from fossil fuels at the end use

2. Decentralization

- Investing in local generation - solar and batteries

3. Digitization

- Grid intelligence in the form of sensors and automation
- Replacing electromechanical devices

A Fourth Trend

The industry is changing.

Generate → Transmit → Deliver

- Decarbonization of power supply
- Decentralization
- Digitization
- **Members are changing**
 - More diverse
 - Tech is easy to integrate in our homes
 - Concerns about the environment

Member Adaptation — ‘Bring Your Own Device’ Era Expands

Trico's Future

TRICO

AN ENERGY COOPERATIVE

POWERED WITH PURPOSE.

2030 Vision

“ To be our member’s
energy provider
and partner of choice.”

Advanced Grid

Strategic Initiative:

Pursue advanced grid technology in order to increase reliability and to meet member's needs

Grid Modernization

DERMS

Implementation of load control measures can offer targeted reduction of system loading to reduce demand during critical periods.

Goals

- Peak shaving
- Demand Reduction
- Energy Conservation
- Market Transactions

Programs

- Smart Thermostats
- Water Heaters
- Battery Storage
- Heat Pumps
- Electric Vehicles

Thank you!

Hot Showers & (no) Cold Calls

Wesley Whited
Principal Consultant – IoT Technology

www.linkedin.com/in/wesley-whited

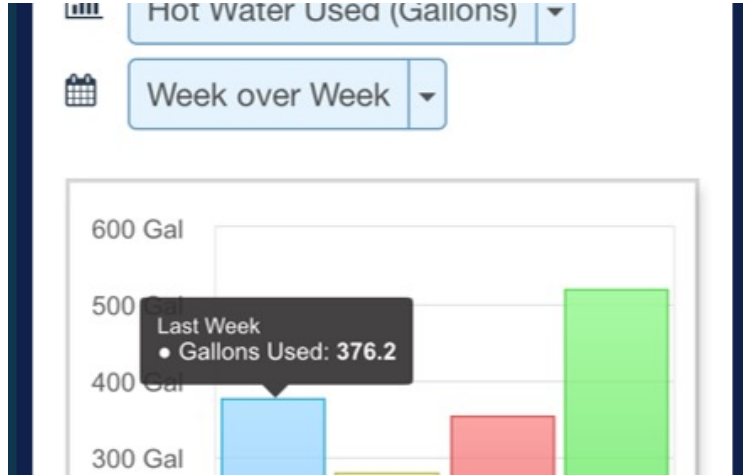

Why build a distributed, thermal battery?

Grid Flexibility

Solar PV to be 46% of installed capacity by 2050
Demand for electricity will double

Economic Value

Customers spend \$35B /year to heat water
Utilities can stack multiple value streams

Non-Energy Benefits

App based controls for customers & utilities
Predictive maintenance & proactive replacement

Domestic hot water: an uncharged battery

118M+ Residential WH Installed Base

- Natural Gas: 48%
- Electric: 46%
- Other Fuel: 6%

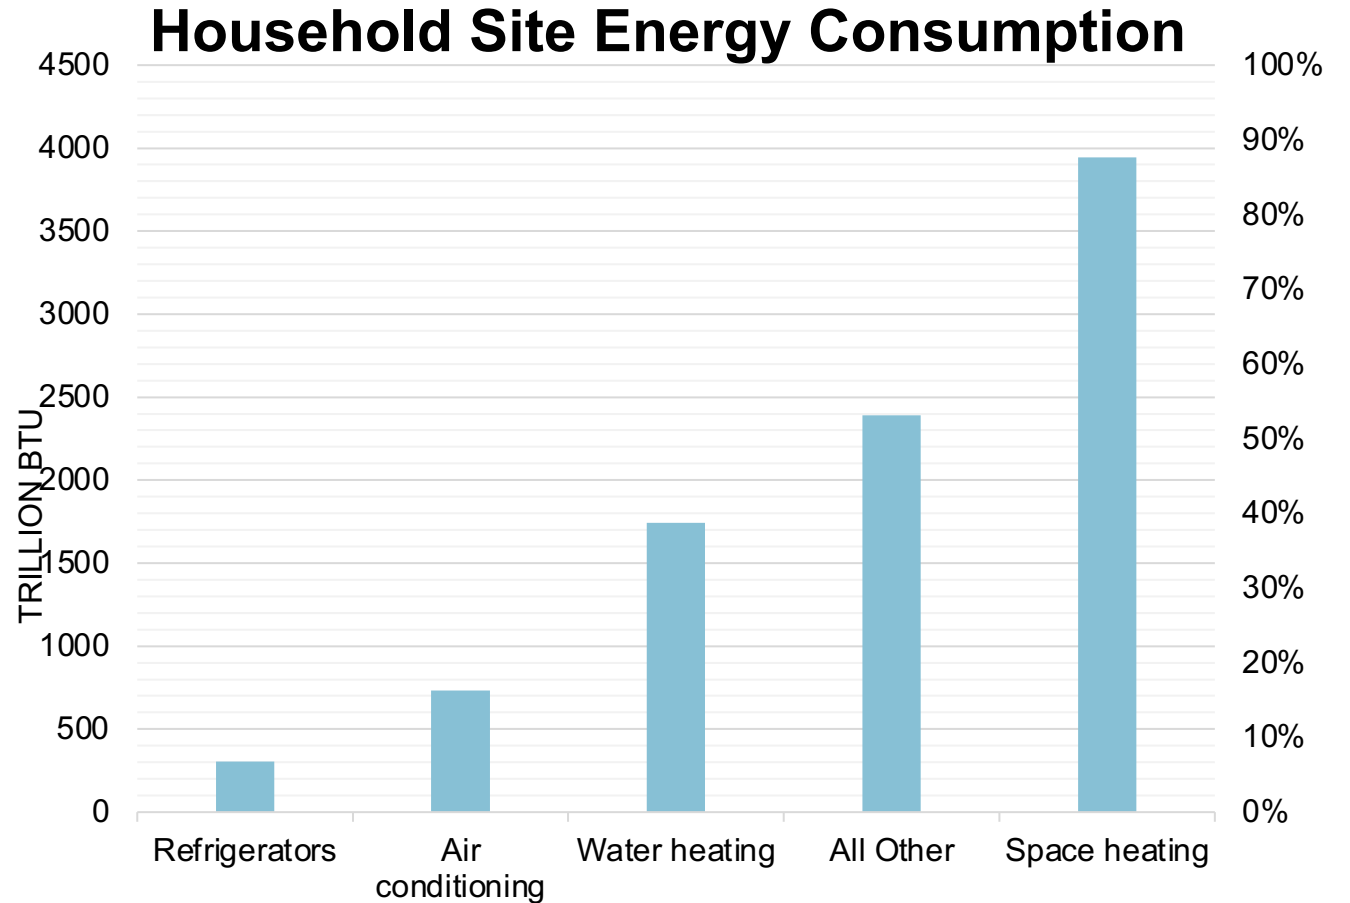

19% of average household energy use

- 1,750 Trillion Btu
- 150mm metric tons CO2

Nominal Storage Size

- <30G: 13%
- 31-49G: 44%
- 50G+: 27%
- Tankless: 3%
- Central WH: 14%

2/3rds of units <10 years old

Types of water heater controllers

Retrofit controller for ERWH

- Unlocks multiple value streams
- Installation does not alter tank
- Optional sensors

CTA-2045 device for HPWH

- Plug-n-Play connectivity
- Same value stacking options
- Pair w/HPWH at time of sale

Utility Use Cases

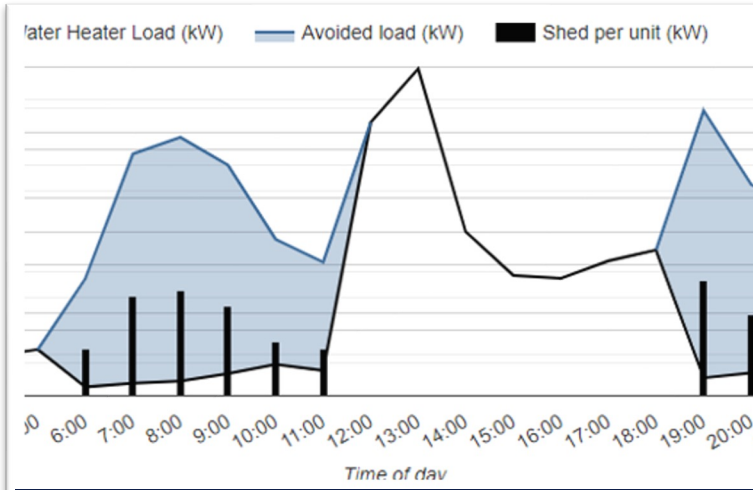

The top 3 utility use cases

104 Units Peak Shaving @ 4:00 PM

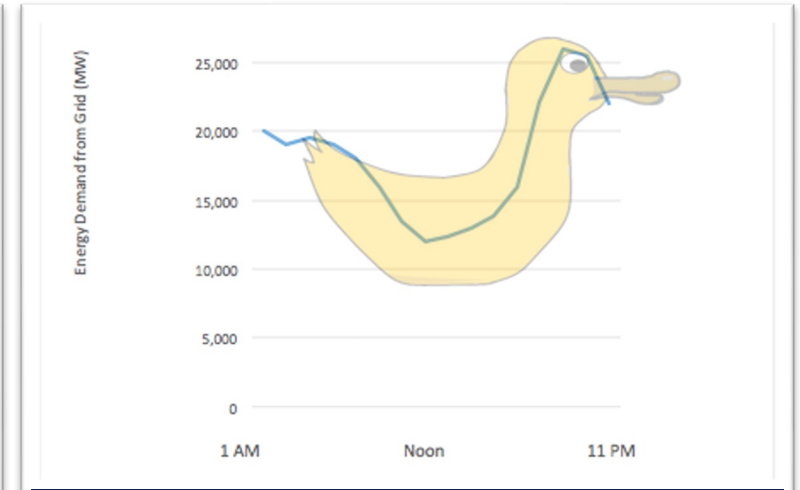

Prices to devices

- Automated load shed based on a customer defined price trigger
- Device is registered and assigned a resource ID by an aggregator
- Device & Aggregator communicate over the life of an event

TOU rate integration

- Time sensitive rates loaded into the devices firmware
- Learning Algorithm baselines a user's consumption pattern
- Load is scheduled out of high price periods; rebound occurs during low price periods

Solar sponging

- Optimize recharge cycle to soak up excess solar capacity
- Solar sponging pairs well with normal customer demand for DHW
- Estimated 30% reduction in water heating CO₂

Energy equity

HIGHEST CONCENTRATION OF EXISTING ELECTRIC WH ARE IN THE SOUTH & SOUTHWEST

MOBILE HOMES HAVE THE HIGHEST LIKELIHOOD OF USING AN ERWH

CONTROLLERS CUT ENERGY CONSUMPTION BY 2-10% BY REDUCING STAND-BY LOSSES

PEAK SHAVING & THERMAL STORAGE SHIFT LOAD INTO MORE AFFORDABLE TIMES

FREQUENCY REGULATION & DR OFFER PASSIVE INCOME STREAM OPPORTUNITIES
